

Tidy Data with

Number of children by year and gender

Can we calculate the ratio of boys to girls?

```
babynames %>%  
  group_by(year, sex) %>%  
  summarise(n = sum(n))
```

	year	sex	n
	<dbl>	<chr>	<int>
1	1880	F	90993
2	1880	M	110491
3	1881	F	91954
4	1881	M	100745
5	1882	F	107850
6	1882	M	113688

Can we calculate the ratio of boys to girls?

```
babynames %>%  
  group_by(year, sex) %>%  
  summarise(n = sum(n))
```

	year	sex	n
	<dbl>	<chr>	<int>
1	1880	F	90993
2	1880	M	110491
3	1881	F	91954
4	1881	M	100745
5	1882	F	107850
6	1882	M	113688

**Now
what?**

Can we calculate the ratio of boys to girls?

```
better_layout %>%
```

```
  mutate(percent_male = M / (M + F) * 100)
```

	year	sex	n
	<dbl>	<chr>	<int>
1	1880	F	90993
2	1880	M	110491
3	1881	F	91954
4	1881	M	100745
5	1882	F	107850
6	1882	M	113688

	year	F	M
	<dbl>	<int>	<int>
1	1880	90993	110491
2	1881	91954	100745
3	1882	107850	113688
4	1883	112321	104629
5	1884	129022	114445
6	1885	133055	107800

tidyr

tidyr

A package that reshapes the layout of tabular data.

spread()

Toy data

```
pollution <- tribble(  
  ~city, ~size, ~amount,  
  "New York", large, 23,  
  "New York", small, 14,  
  "London", large, 22,  
  "London", small, 16,  
  "Beijing", large, 121,  
  "Beijing", small, 121  
)
```

pollution

city	size	amount
New York	large	23
New York	small	14
London	large	22
London	small	16
Beijing	large	121
Beijing	small	56

Your Turn

On a sheet of paper, draw how this data set would look if it had the same values grouped into three columns: *city*, *large*, *small*

city	size	amount

London	22	16
Beijing	121	56

spread()

Generates multiple columns from two columns:

- unique values in the **key** column become **column names**
- values in the **value** column become **cells** in the new columns

```
spread(pollution, size, amount)
```

**data frame to
reshape**

**column to use for keys
(new columns names)**

**column to use for values
(new column cells)**

```
spread(pollution, size, amount)
```

	city	size	amount
1	New York	large	23
2	New York	small	14
3	London	large	22
4	London	small	16
5	Beijing	large	121
6	Beijing	small	56

	city	large	small
1	Beijing	121	56
2	London	22	16
3	New York	23	14

Your Turn

Reshape the layout of this data. Calculate the percent of male children by year. And then plot the percent over time.

```
babynames %>%  
  group_by(year, sex) %>%  
  summarise(n = sum(n))
```

05:00

```
babynames %>%  
  group_by(year, sex) %>%  
  summarise(n = sum(n)) %>%  
  spread(sex, n) %>%  
  mutate(percent_male = M / (M + F) * 100) %>%  
  ggplot(aes(year, percent_male)) + geom_line()
```

Percent of children that are male by year

Reshaping tables

`spread()` is one of a family of functions for reshaping tables.

- `spread()` - move values into column names
- `gather()` - move column names into values
- `separate()` - separate variables that share a column
- `unite()` - unite a variable that is split across several columns

Tidy Data

Tidy data

Tidy functions all expect and return the same data structure, known as **tidy data**:

1. A **data frame** that contains
2. **variables** in the **columns** and
3. **cases** in the **rows**.

```
View(table1)
```

(Applied) Data Science

Program

who
(Untidy Data)

who

Tuberculosis (TB) cases broken down by year, country, age, gender, and diagnosis method from the *2014 World Health Organization Global Tuberculosis Report*

[View\(who\)](#)

What variables does this data set contain?

Showing 1 to 22 of 7,240 entries

who variables

country		iso2	iso3	year	new_sp_m014
----------------	--	-------------	-------------	-------------	--------------------

country, iso2, iso3 - country identifiers

year - year

other columns names - encode **type** of TB case, **sex**, and **age**

who codes

new_sp_m014

Type of TB case

- **rel** - relapse
- **ep** - extra-pulmonary
- **sn** - pulmonary, smear negative
- **sp** - pulmonary, smear positive

Gender

- **m** - male
- **f** - female

Age group

- **014** - 0 to 14 years old
- **1524** - 15 to 24 years old
- **2534** - 25 to 34 years old
- **3544** - 35 to 44 years old
- **4554** - 45 to 54 years old
- **5564** - 55 to 64 years old
- **65** - 65 and older

9	US	"2013"	13000

Your Turn

Gather the 5th through 60th columns of who into a key column:
value column pair named codes and n.

Then select just the county, year, codes and n variables.

05:00

who %>%

```
gather("codes", "n", 5:60) %>%
```

```
select(-iso2, -iso3)
```

	country	year	codes	n
1	Afghanistan	1980	new_sp_m014	NA
2	Afghanistan	1981	new_sp_m014	NA
3	Afghanistan	1982	new_sp_m014	NA

10	Afghanistan	1989	new_sp_m014	NA
11	Afghanistan	1990	new_sp_m014	NA
12	Afghanistan	1991	new_sp_m014	NA

separate()

Quiz

What variables are "hidden" here in plain sight?

storms

storm	wind	pressure	date
Alberto	110	1007	2000-08-12
Alex	45	1009	1998-07-30
Allison	65	1005	1995-06-04
Ana	40	1013	1997-07-01
Arlene	50	1010	1999-06-13
Arthur	45	1010	1996-06-21

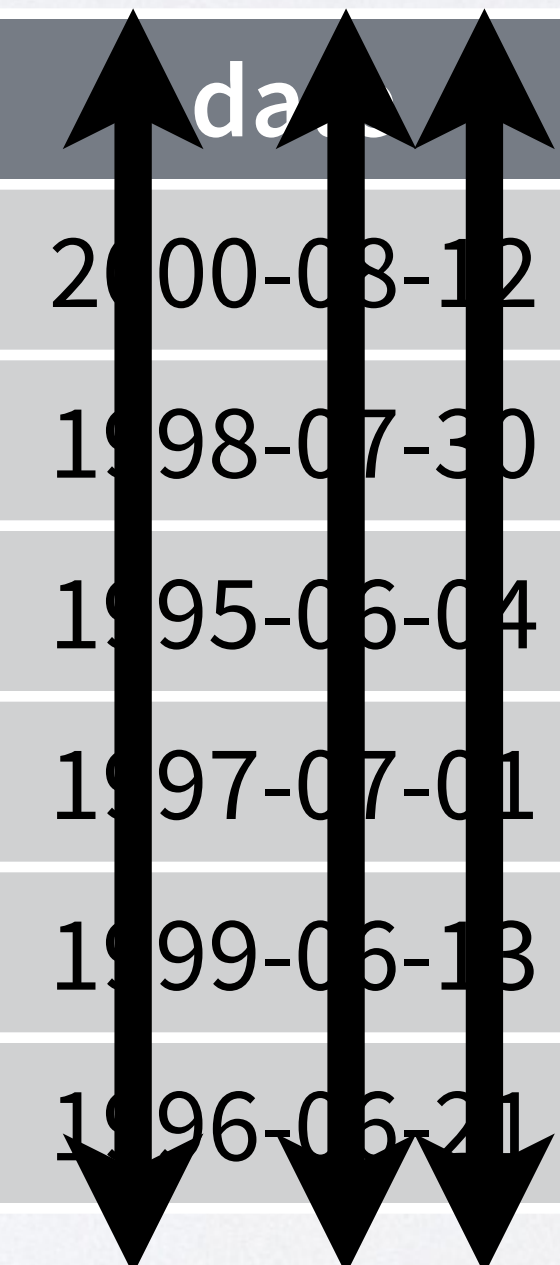

Quiz

What variables are "hidden" here in plain sight?

- year
- month
- day

storms

storm	wind	pressure	date
Alberto	110	1007	2000-08-12
Alex	45	1009	1998-07-30
Allison	65	1005	1995-06-04
Ana	40	1013	1997-07-01
Arlene	50	1010	1999-06-18
Arthur	45	1010	1996-06-21

separate()

Splits a column by dividing values at a specific character.

```
separate(storms, date, c("year", "month", "day"), sep = "-")
```

**data frame to
reshape**

**a column to
split**

**names of new
columns to
make**

string to split on
(Defaults to any non_alpha-
numeric character)

```
separate(storms, date, c("year", "month", "day"), sep = "-")
```

	storm	wind	pressure	date
1	Alberto	110	1007	2000-08-03
2	Alex	45	1009	1998-07-27
3	Allison	65	1005	1995-06-03

5	Arlene	50	1010	1999	06	11
6	Arthur	45	1010	1996	06	17

Converts
numeric
column names
to numbers

Your Turn

Separate the codes column into three columns at the underscores. Use the column names "new", "type", "sexage". Then select everything but the "new" column.

A digital timer display showing the time 02:00. The digits are black with a white outline, set against a white background with a thin black border.

who %>%

```
gather("codes", "n", 5:60) %>%
```

```
select(-iso2, -iso3) %>%
```

```
separate(codes, c("new", "type", "sexage"), sep = "_") %>%
```

```
select(-new)
```

	country	year	type	sexage	n
1	Afghanistan	1980	sp	m014	NA
2	Afghanistan	1981	sp	m014	NA
3	Afghanistan	1982	sp	m014	NA
4	Afghanistan	1983	sp	m014	NA
5	Afghanistan	1984	sp	m014	NA
6	Afghanistan	1985	sp	m014	NA
7	Afghanistan	1986	sp	m014	NA
8	Afghanistan	1987	sp	m014	NA
9	Afghanistan	1988	sp	m014	NA
10	Afghanistan	1989	sp	m014	NA

separate()

Splits a column by dividing values at a specific character.

```
separate(storms, date, c("year", "rest"), sep = c(4, 8))
```

locations to split at

(Split after 4th and 8th
characters)

Your Turn

Separate the sexage column into sex and age columns.

01:00

who %>%

```
gather("codes", "n", 5:60) %>%
```

```
select(-iso2, -iso3) %>%
```

```
separate(codes, c("new", "type", "sexage"), sep = "_") %>%
```

```
select(-new) %>%
```

```
separate(sexage, c("sex", "age"), sep = 2)
```

	country	year	type	sex	age	n
1	Afghanistan	1980	sp	m	014	NA
2	Afghanistan	1981	sp	m	014	NA
3	Afghanistan	1982	sp	m	014	NA
4	Afghanistan	1983	sp	m	014	NA
5	Afghanistan	1984	sp	m	014	NA
6	Afghanistan	1985	sp	m	014	NA
7	Afghanistan	1986	sp	m	014	NA
8	Afghanistan	1987	sp	m	014	NA
9	Afghanistan	1988	sp	m	014	NA
10	Afghanistan	1989	sp	m	014	NA

separate_rows()

Splits a column. Creates a new row for each result.

```
separate_rows(storms, date, sep = "-", convert = TRUE)
```

storms

storm	wind	pressure	date
Alberto	110	1007	2000-08-12
Alex	45	1009	1998-07-30

8	Allison	65	1005	6
9	Allison	65	1005	3

unite()

unite()

Unites columns into single column by combining cells.

```
unite(data, col, ..., sep = "")
```

**data frame
to reshape**

**name of new
column to
make
(in quotes)**

**two or more
columns to
combine**

**separator to place
between elements in
new column**
(Defaults to an underscore)

Your Turn

Use `separate()` and then `unite()` to change how storms codes date, as below.

storms

storm	wind	pressure	date
Alberto	110	1007	2000-08-12
Alex	45	1009	1998-07-30
Allison	65	1005	1995-06-04
Ana	40	1013	1997-07-01
Arlene	50	1010	1999-06-13
Arthur	45	1010	1996-06-21

storm	wind	pressure	date
Alberto	110	1007	08/12/2000
Alex	45	1009	07/30/1998
Allison	65	1005	06/04/1995
Ana	40	1013	07/01/1997
Arlene	50	1010	06/13/1999
Arthur	45	1010	06/21/1996

03:00

```
storms %>%
```

```
  separate(date, c("year", "month", "day"), sep = "-") %>%
```

```
  unite("date", month, day, year, sep = "/")
```

Missing Values

Can we clean up the missing values?

	country	year	type	sex	age	n
1	Afghanistan	1980	sp	m	014	NA
2	Afghanistan	1981	sp	m	014	NA
3	Afghanistan	1982	sp	m	014	NA
4	Afghanistan	1983	sp	m	014	NA
5	Afghanistan	1984	sp	m	014	NA
6	Afghanistan	1985	sp	m	014	NA
7	Afghanistan	1986	sp	m	014	NA
8	Afghanistan	1987	sp	m	014	NA
9	Afghanistan	1988	sp	m	014	NA
10	Afghanistan	1989	sp	m	014	NA
11	Afghanistan	1990	sp	m	014	NA
12	Afghanistan	1991	sp	m	014	NA
13	Afghanistan	1992	sp	m	014	NA

Toy data

```
x <- tribble(
  ~x1, ~x2,
  "A",  1,
  "B", NA,
  "C", NA,
  "D",  3,
  "E", NA
)
```

x

x1	x2
A	1
B	NA
C	NA
D	3
E	NA

fill()

Fills in NA's with preceding (or following) values.

```
fill(x, x2, .direction = "down")
```

**data frame to
transform**

**column(s) with
NA's to replace**

**"down" fills each NA with
the preceding value, "up"
with the following value**

fill()

Fills in NA's with preceding (or following) values.

```
fill(x, x2, .direction = "down")
```

^x
X

x1	x2		x1	x2
A	1	→	A	1
B	NA		B	1
C	NA		C	1
D	3		D	3
E	NA		E	3

fill()

Fills in NA's with preceding (or following) values.

```
fill(x, x2, .direction = "up")
```

^x
X

x1	x2		x1	x2
A	1	→	A	1
B	NA		B	3
C	NA		C	3
D	3		D	3
E	NA		E	NA

replace_na()

Replace NA's by column.

```
replace_na(x, replace = list(x2 = 2))
```

**data frame to
transform**

**A named list of
column names paired
with values to replace
NA's with.**

replace_na()

Replace NA's by column.

```
replace_na(x, replace = list(x2 = 2))
```

^x
X

x1	x2		x1	x2
A	1	→	A	1
B	NA		B	2
C	NA		C	2
D	3		D	3
E	NA		E	2

drop()

Drops rows that contain NA's in the specified columns.

```
drop_na(x, x2)
```

**data frame to
transform**

**column(s) to
screen for NA's**

drop_na()

Drops rows that contain NA's in the specified columns.

```
drop_na(x, x2)
```

^x
X

x1	x2
A	1
B	NA
C	NA
D	3
E	NA

→

x1	x2
A	1
D	3

who %>%

```
gather("codes", "n", 5:60) %>%
```

```
separate(codes, c("new", "type", "sexage"), sep = "_") %>%
```

```
select(-new, -iso2, -iso3) %>%
```

```
separate(sexage, c("sex", "age"), sep = 2) %>%
```

```
drop_na(n)
```

	country	year	type	sex	age	n
1	Afghanistan	1997	sp	m0	14	0
2	Afghanistan	1998	sp	m0	14	30
3	Afghanistan	1999	sp	m0	14	8
4	Afghanistan	2000	sp	m0	14	52
5	Afghanistan	2001	sp	m0	14	129

8	Afghanistan	2004	sp	m0	14	139
9	Afghanistan	2005	sp	m0	14	151

Recap

Move values into column names with **spread()**

Move column names into values with **gather()**

Split a column with **separate()** or **separate_rows()**

Unite columns with **unite()**

The role of tidy data in the tidyverse

Tidy data

Tidy functions **all expect and return the same data structure**, known as tidy data:

1. A **data frame** that contains
2. **variables** in the **columns** and
3. **cases** in the **rows**.

Tidy data

Tidy functions all expect and return the same data structure, known as **tidy data**:

1. A **data frame** that contains
2. **variables** in the **columns** and
3. **cases** in the **rows**.

Which is tidy? What is a variable?

```
layout1 %>%  
  ggplot(aes(year, n)) +  
  geom_line(aes(color = sex))
```

	year	sex	n
	<dbl>	<chr>	<int>
1	1880	F	90993
2	1880	M	110491
3	1881	F	91954
4	1881	M	100745
5	1882	F	107850
6	1882	M	113688

```
layout2 %>%  
  mutate(pmale = M / (M + F))
```

	year	F	M
*	<dbl>	<int>	<int>
1	1880	90993	110491
2	1881	91954	100745
3	1882	107850	113688
4	1883	112321	104629
5	1884	129022	114445
6	1885	133055	107800

General advice

Describe what you want to do in an **equation**. Each variable in the equation should correspond to a variable in your data:

- "color by sex"
color = sex
- "calculate the proportion of males"
prop male = number of males / number of females + number of males

Tidy Data with

Reshaping Final Exam

"Tidy data sets are all alike; but every messy data set is messy in its own way."

- Hadley Wickham

Your Turn

In your groups, use **spread()**, **gather()**, **separate()**, and/or **unite()** to tidy each of the following tables:

- table2
- table3
- table4a - does not contain population
- table4b - does not contain cases
- table5

Unless otherwise specified, each contains a country, year, cases, and population variable.

A digital timer with a black border, displaying the time 10:00 in a large, black, digital font. The digits are slightly shadowed, giving it a 3D appearance.

```
table2 %>%  
  spread(type, count)
```

```
table3 %>%  
  separate(rate, c("cases", "population"), sep = "/",  
            convert = TRUE)
```

```
table4a %>%  
  gather("year", "cases", 2:3, convert = TRUE)
```

```
table4b %>%  
  gather("year", "population", 2:3, convert = TRUE)
```

```
table5 %>%  
  unite("year", century, year, sep = "") %>%  
  separate(rate, c("cases", "population"), sep = "/",  
    convert = TRUE)
```
